

AAC Clyde Space receives SEK 7 million defence order from a NATO country

AAC Clyde Space's subsidiary Spacemetric has received an order valued at approximately SEK 7 million from a defence force in a NATO country. Spacemetric will deliver its Keystone server software for precision correction of high-resolution satellite data, with deliveries starting in Q4 2026. The agreement also includes options worth up to an additional SEK 8 million.

Spacemetric develops software and systems for managing, processing and distributing geospatial imagery and other sensor data. Keystone is designed to process high-resolution satellite data with low latency, making corrected geospatial data rapidly available for analysis and operational use.

"This order shows the value of the specialist geospatial capability we have in Spacemetric. Being able to turn high-resolution satellite data into usable information quickly is increasingly important for situational awareness and operational decision-making," says Luis Gomes, CEO of AAC Clyde Space.

About Spacemetric

Spacemetric, a subsidiary of AAC Clyde Space, has supported security and defence customers for more than two decades. Its Keystone technology has been used by the Swedish Armed Forces to manage reconnaissance imagery and video from manned and unmanned aerial vehicles. The technology has also been adapted for information sharing within NATO's Federated Mission Networking framework. Spacemetric has contributed technology and expertise to PEONEER, a project funded by the European Defence Industrial Development Programme (EDIDP), to develop advanced geospatial intelligence and decision-support capabilities. In 2025, the company was awarded a project under the Swedish National Space Agency's Dual-Use Space Technology Programme to further develop and demonstrate its Bluestone software for advanced onboard data processing and data fusion in civil and defence applications.
