

## Wyld Networks announces multi-operator capability for satellite IoT

**Wyld Networks announce a new release of Wyld Connect and Wyld Fusion to support multi-operator capability for satellite IoT. The new release of Wyld Connect reduces latency and increases capacity for delivering data via our partnerships with satellite operators Eutelsat and Lacuna. The new release of Wyld Fusion provides one platform for our customers to seamlessly manage their data across multiple constellations.**

Each of our satellite operator partners has their own Low Earth Orbit satellite constellation. Wyld can communicate with each of these constellations from the one Wyld Connect module and our customers can enjoy a secure and efficient, end-to-end data management experience with Wyld Fusion. This unique satellite IoT solution reduces latency and increases capacity making sensor data even easier to obtain for sectors such as energy, utilities, agriculture, logistics and environmental management.

The LoRa FHSS protocol is used by Wyld to establish communication with Low Earth Orbiting satellites. Wyld's AM102 IoT modules are built to easily embed into thousands of third-party sensor and device designs and will provide the required radio connectivity to allow businesses to receive data even from the most remote locations on earth.

Sensor data once collected and delivered via satellite to a ground station is then managed in Wyld Fusion. With many features such as easy onboarding, secure device provisioning, and flexible data transformation that enables effective data segmentation, Wyld Fusion is a network management platform designed for multiple operator support.

This overall strategy will enable more use cases across more business verticals.

"These new releases of Wyld Connect and Wyld Fusion from our first-class hardware and software engineering teams, deliver seamless multiple satellite operator connectivity," said Alastair Williamson, CEO of Wyld Networks. "We are delighted to bring to market this new capability for our customers enabling data delivery from sensors on the ground to the end applications our customers use. As the rapid growth of Satellite IoT continues this multi-operator capability will further enable scalability for the Wyld Data service."
